Activation of $\alpha 5$ -GABA receptor inhibits glutamate release in rat striatum. $\alpha 5$ -GABAA receptor ($\alpha 5$ -GABAAR) activation is known to suppress the release of other neurotransmitters, such as glutamate. The present study examined whether $\alpha 5$ -GABAAR activation modulates the release of glutamate in the rat striatum. Intracellular recording was performed in the striatum slices. The application of the $\alpha 5$ -GABAAR agonist, ($\alpha 5$)-AMPA, suppressed the frequency of mEPSCs in the striatal neurons of the slice, but did not affect the amplitude of mEPSCs. Perfusion of the glutamate uptake inhibitor, DL-TBOA, enhanced the frequency of mEPSCs, but reduced the amplitude of mEPSCs. The selective $\alpha 5$ -GABAAR antagonist, ($\alpha 5$)-SR 95531, suppressed the suppression of the amplitude of mEPSCs induced by ($\alpha 5$)-AMPA. These findings suggest that the activation of $\alpha 5$ -GABAAR suppresses the glutamate release in the striatum. Overexpression of osteopontin is associated with poor prognosis in osteosarcoma patients. Osteopontin (OPN) is a promising candidate for a new prognostic biomarker in various cancers. The aim of this study was to determine the clinicopathological significance of OPN expression and to examine the association of OPN expression with osteosarcoma metastasis. A tissue microarray (TMA) was constructed and OPN expression was examined in primary tumor tissues of the osteosarcoma patients in 124 patients. Immunohistochemistry staining and Western blotting were performed to measure OPN expression levels in tumor tissues and their adjacent normal tissues. OPN expression levels in tumor tissues were significantly higher than in the adjacent normal tissues, both by immunohistochemistry staining and Western blotting. High OPN expression was associated with high tumor grade and poor overall survival. 1d6a3396d6

Heterogeneous nuclear ribonucleoprotein C proteins (hnRNP) are of emerging interest because of their role in translational regulation, but also because of their involvement in cellular proliferation and tumorigenesis. The hnRNP proteins are interesting because they are expressed at different levels in the developing cerebellum and have been linked to neuronal differentiation. Some hnRNP genes have been shown to possess oncogenic potential in rodent tumors. Most recently, somatic mutations in the hnRNP genes have been associated with a rare, familial cancer syndrome with an autosomal dominant inheritance pattern. Since the available expression data on hnRNP proteins are relatively limited, we have undertaken studies to examine the expression pattern of these proteins in the developing and mature brain and have compared them to other nuclear and cytoplasmic proteins. We find the h
